THE BLUEBERRY

Our Cluster Blueberry Nursery of Well-headed and Well-rooted Trees

The Blueberry, one of the oldest and most favorably known of American fruits, seem destined, within the next few years, to take first place among the choicest of berries.

So striking have been the results of experiments in the selection of certain strains of the Blueberry and its proper cultivation as an orchard fruit, the conservative Department of Agriculture feels justified in saying: "The introduction of the Blueberry into agriculture has a much more profound significance than the mere addition of one more agricultural industry to those already in existence."

In the extreme South, no great distinction has heretofore been drawn between the Huckleberry and the Blueberry—two distinct species of fruit. The small Huckleberry, with its ten large seeds, a shrub of very wide distribution, has often been confused with the large, deliciously flavored, small seed Blueberry, and this confusion of species has held back the development of the Blueberry as a very profitable orchard fruit. Even now people are slow in making a distinction between our common small-shrub Blueberry with its single berries and the new Blueberry with its 10 foot bush and great clusters of magnificent fruit.

In the United States, the Blueberry seems to have reached the highest development near Whitesbogg, N. J., and Okaloosa County in West Florida. Some thirty-five years ago, Mr. M. A. Sapp, of West Florida, began the systematic cultivation of the Blueberry, and the success he has attained has attracted national notice.

RANGE OF THE BLUEBERRY

The success of the Blueberry is assured over the territory covered by natural growth of the common Huckleberry. This may easily be said to comprise the Southern States with the exception of those regions containing too much lime.

Soil requirements for the Blueberry make it extremely well-suited to Southern coast soils. It **THRIVES** on acid soil and yet one well aerated and constantly supplied with a moderate degree of moisture. These requirements of the Blueberry pre-eminently fit it for much of our soil, at present unfit for the cultivation of field or orchard crops **BECAUSE** of the over-acidity and moisture. It seems to thrive wonderfully on the sandiest and poorest of the soils.

ORCHARDS QUICKLY DEVELOPED

The cultivated Blueberry comes into bearing two years after transplanting, and actual field records show that the following yields per tree can be relied on: 2nd year, 1 quart; 3rd year, 3 quarts; 4th year, 5 quarts; 5th year, 8 quarts; 7th year, 15 quarts; 9th year, 22 quarts; 11th year, 30 quarts.

The trees are set 15 by 15 feet, giving 193 to the acre. The trees reach a height of about ten feet and a spread of eight to ten feet. Up to the present time, no disease has attacked the Blueberry, and spraying is entirely unnecessary. It is proving the most easily cultivated of orchard trees and the fruit is produced and marketed at a very small expense.

FRUIT

Blueberries begin ripening in June and are picked weekly during the months of June, July and August. The berries grow in clusters very much like grapes and vary in size from one-fourth to one-half inch in diameter. The presence of a dense bloom over an almost black skin gives the Blueberry a beautifully attractive bluish color, and the absence of moist berries or berries withered from exposure to atmosphere makes a bowl of blueberries the most appetizing of fruits. They are eaten raw with sugar and cream and preserved like strawberries.

Price **GUARANTEED** cluster Blueberry trees nursery grown, well-headed and well-rooted, F. O. B. Crestview, Florida.

PERTINENT COMMENT

In a letter to the Sapp Blueberry Farm, Luther Butbank, says:

"Your astounding success with the Blueberry will help to make **THE BLUEBERRY COME TO ITS OWN**, as I think it is the best berry ever raised."

Mr. W. A. Cox, Gulfport, Miss.:

Dear Sir—I am in receipt of yours, asking for information relative to blueberry orchards, their yield, etc.

My oldest trees are 33 years of age. I have cultivated them very little. I find that it pays to use some fertilizer and give them clean cultivation.

My youngest grove ranges from 2 1-2 to 3 1-2 years of age. Trees begin to bear 2 years after planting.

My nine-year grove, which is really my best orchard, pays me annually about \$500 per acre.

I find a ready sale for all blueberries that can be produced at \$6.00 per crate (24 quarts).

I have never missed a crop of berries all these years. I have never sprayed my trees and no disease has ver been discovered on any of them as yet. No refrigeration is required in shipping the fruit, as they carry in good condition into the Northern cities, will keep in good condition for 6 or 8 days.

In my estimation the blueberry of this section is one of the best berry trees known and we would recommend to any one that desires to make money that they plant blueberry trees.

I believe that 2 acres at from 7 to 10 years of age would support any common little family, by doing all the picking themselves.

Yours truly,

M. A. SAPP.

West Florida, August 29th, 1923.

W. A. Cox, Gulfport, Miss.

Dear Sir—I have been growing the now famous Blueberry trees in orchards for a number of years. These plants were taken from the forests 12 years ago.

I have kept a record of a number of these trees as to yield and I find that some of these trees have yielded as much as 50 quarts per tree at 12 years of age, and I think that I am safe in saying that the average yield of all of my other trees that are now 8 and 12 years of age will average 20 quarts per tree annually. I believe that there is more money to be made from a blueberry orchard when properly cared for than almost any kind of orchard that can be planted.

The demand has been far greater than the supply through this territory for this wonderful berry.

Yours truly,

W. R. LOCKE.

West Florida, August 29th, 1923.

YOUR WASTE LAND

In the Southern States there are thousands of acres of waste land, or unused land. On every plantation or farm there's a creek or corner cut off from the balance of the place by a ravine, often there's a back pasture that is ideal for the growing of pecans.

Pecans thrive in the wild state along the creeks and river bottoms of all the Southern States and thousands of the (small) native pecans are marketed with profit each year.

Now I'm serious in trying to get you to use all these unused corners of space that is now waste land. Suppose you had planted even 10 grafted pecan trees each year on the odd corner or creek bottoms of your home place.

Take five acres and plant "gold nugget" grafted pecan trees 50 feet apart, 17 trees to the acre, the pecans will bear some the fourth year after planting grafted stock. In the meantime plant blueberries (the huckleberry's cousin) between the rows during June, July and August of the year they are planted you can pick and sell blueberries and they will increase in production each year.

The blueberry tree will pay for the care of the pecans until they bear and show a profit besides thus giving you a twice-a-year pay-day inside of five years.

So lets not put all the eggs in one basket—lets have two sure producing trees in the same grove—neither of which are affected by the cold weather—five acres of either pecans or blueberries will pay for the boy's college course—plant both on the same five acres and send them all to college.

Mark Twain in his story "Huckleberry Finn" makes you think of huckleberry pies, fishing and boy fun so we ask you to "thing" of the huckleberry's cousin the blueberry—a native of the South yet growing in parts of New Jersey, the blueberry has recently come into its proper place as a delicious fruit-food. I want you to get this fact, blueberries will grow "where the huckleberry grows"—you may have a half acre of land that you do not use at present. I want to picture to you that that half acre one year from today with the bushes almost waist high and realize you can in June, July, and August of next year actually pick your own blueberries and sell them at a good price. The market will not be supplied for years and each year you will be able to market more and more blueberries—remember the berries keep well, ship well and bring a good price—wherever you live I'm sure you know "where the huckleberry grows"—the blueberry grows and thrives in any acid soil.

THE FOLLOWING HAS RECENTLY BEEN WRITTEN IN A BULLETIN ON THE BLUEBERRY BY THE STAFF OF THE DEVELOPMENT BOARD OF THE SEA BOARD AIR LINE RAILWAY COMPANY OF SAVANNAH, GEORGIA.

"ADVANTAGES OF THE TREE BLUEBERRY"

"Abundant annual crops are produced regardless of weather conditions.

No difficult cultivation is needed to develop an orchard or to keep it bearing.

No large amounts of commercial fertilizers are required.

The cost of securing trees is small.

Spraying is unnecessary for disease or insect pests.

No pruning is needed.

The markets are taking all berries offered at good prices.

The harvesting is extended over a long period of time; so there is no rush season to gather the crop and there is no long waiting after planting before trees yield a worthwhile crop."

SEVEN
Hundred
dollars an acre
is the value of
the crop from
this orchard.

Nine-year Old Cluster Blueberry Orchard Yielding Heavily

THE SATSUMA ORANGE

No tree is so deeply associated in the human mind with prosperity and happiness as the Orange. The orange has been a favorite fruit of the East and the West since the dawn of time. It is the most delicious and healthful of fruits, and its juice is the most refreshing and invigorating of beverages.

The Satsuma Orange is a native of China and was introduced into this country in 1878. It is a small, round, orange-colored fruit, and is the most delicious and healthful of oranges. It is the most profitable and permanent investment in the agricultural line.

The Satsuma Orange is a native of China and was introduced into this country in 1878. It is a small, round, orange-colored fruit, and is the most delicious and healthful of oranges. It is the most profitable and permanent investment in the agricultural line.

Price of Satsuma Oranges

Size	Each	Per 10	Per 100
2 1/2 to 3 Feet	75	\$ 7.50	\$ 75.00
3 to 4 Feet	85	8.50	85.00
4 to 5 Feet	95	9.50	95.00

MEYER COMMERCIAL LEMON

The Meyer Commercial Lemon was first found in China by Mr. Meyer. It is a small, round, yellow-colored fruit, and is the most delicious and healthful of lemons. It is the most profitable and permanent investment in the agricultural line.

The Meyer Commercial Lemon is a native of China and was introduced into this country in 1878. It is a small, round, yellow-colored fruit, and is the most delicious and healthful of lemons. It is the most profitable and permanent investment in the agricultural line.

Price of Meyer Commercial Lemons

2 to 3 Feet	75	\$ 7.50	\$ 75.00
3 to 4 Feet	85	8.50	85.00

BURBANK Says:

Further Burbank greatest living horticulturist says: "Speaking of pecans, we must dismiss the idea of over-producing the pecan. We have now one pecan where we ought to have a million to create a market. The immense carrying capacity and longevity of pecan orchards make them the most profitable and permanent investment in the agricultural line."

"Meyer Lemons"

Produce every year and were damaged less by cold weather last year than the satsuma orange tree.

The Grapefruit

It is an axiom of horticulture that the farther north a fruit can be safely grown the finer will be its flavor. One has but to think of the sections of the country that produce the finest peaches or apples to know that this is true.

Millions of dollars invested in the grapefruit orchards of Florida, because of this fact, are safe against the competition of the Cuban grapefruit grown in the rich black soil without fertilizers and gathered with cheap labor.

But the law of nature bids that strip lying along the Gulf of Mexico in Mississippi and Alabama, another of its great opportunities in the growing of choice fruits. Here, among the northern limits of its growth, the grapefruit reaches a perfection of flavor found in no other section.

No fruit reaches a bearing period so quickly as the grapefruit in the sunny soil of South Mississippi and no tree equals it, with the possible exception of the Sand pear, in the weight of fruit produced.

With the Satsuma orange, the Sand pear and the paper shell pecan, the grapefruit should be planted on every home place in reach of the tempering sea air, and its production on a tremendously profitable commercial scale is taken as a matter of course by horticulturists of this region.

We are glad to announce that we are able to supply the public this season with choice trees.

Price of Grapefruit Trees

Size	Each	Per 10	Per 100
2 to 3 Feet	75	\$ 7.50	\$ 75.00
3 to 4 Feet	100	9.50	90.00

CAMPHOR TREES

Camphor trees are called that the name implies. Camphor gum is made from its trees. It is a beautiful, ornamental evergreen tree, with dark green foliage. It is a natural, symmetrically headed tree and a rapid grower, reaching a height of from 15 to 20 feet. A splendid tree for park and yard planting or where shade is needed quickly and continuously.

Price of Camphor Trees

Size	Each
4 to 4 Feet	\$ 5.00
4 to 5 Feet	7.50

GRAPE VINES, CONCORD AND NIAGARA

Year	Each	Per 10	Per 100
1-Year	25	\$ 2.50	\$ 25.00
2-Year	35	3.50	35.00
3-Year	40	4.00	40.00

We can supply ornamental trees and shrubs:

Golden Arbor Vitae	Each \$1.50 to \$3.00
Bosch's Arbor Vitae	1.50 to 3.00
Oleander Trees	.40 to 1.00
Washingtonia Palms	.50 to 3.00
Cantharis Palms	.50 to 3.00
Camphor Trees	.50 to 3.00
Camelia Japonica (white, red, pink, variegated)	1.50 to 3.00
Lape Jasmine	.50 to .75
Hardy Bamboo	.50 to 1.00
Virginia Cedar	.50 to 1.00
Wisteria vines	.50 to .75

Thoro-bred Tree Information

Facts about the Blueberry, Pecan, Satsuma Orange, Meyer Lemon and Pineapple Pear Trees—The Variety to Plant and Locality in which they Thrive and Produce Best.

TREES THAT GROW

At 1 year of age this tree produced 10 lbs. pecans. At 5 years of age its yield was 33 pounds.

THE KUMQUAT

When the Kumquat, the smallest member of the citrus family, was introduced into this country, it was considered a mere curiosity. It is now, however, a most profitable and permanent investment in the agricultural line.

The unsurpassed marmalade and jelly made from the Kumquat quickly added the tree to the commercial trees of the citrus family, and now the growing of Kumquats is a very profitable thing. The trees can be planted very close together and yield an enormous crop, which readily brings from \$3.00 to \$4.00 per bushel.

Every home owner should add a few Kumquat trees to his home orchard.

Price of Kumquat Trees

Year	Each	Per 10
1 year old	\$1.00	\$ 9.00
2 year old (bearing)	1.50	14.00
3 year old (bearing)	2.00	19.00

ON TRIFOLIATA STOCK

All our Satsuma Oranges, Grapefruit, Kumquats, and Meyer Lemons are grafted on trifoliata stock, which has been found most resistant to cold and best adapted to this soil. It will be found a mistake to attempt to grow citrus fruit on any other roots.

A Plain Statement by a Nurseryman

I want you to think for a few moments that what I write about pecans is written for YOUR benefit as well as MINE.

The YOUNG Nurseryman and each tree I send you I have planted and cared for with "loving kindness" yes I have actually lived with the plants, personally cared for them, fed them the proper plant food, grafted them with the scion to produce a sturdy tree that will in time bear fruit that you will know as "Nuggets of Gold" yes, I mean just that for a pecan grove or even a few trees planted on the "waste" land of your home place and will take care of you when you feel it's time for you to retire.

I am NOT interested in selling you "gold nugget" pecan trees that have had personal care all their life if you are intending to stick them in the ground and see if they will grow. You may better understand what I mean by loving, even a pecan tree, when I tell you that recently when talking to a planter whom I had sold some 250 trees, he told me that many of them did not live, etc., etc.

I asked this man to come with me to my own grove planted at the same time from the same rows of nursery stock. The man stood with balled arms and marveled at the health and vigorous growth of my own trees while I explained the only difference between the two groves was in the "loving care" and thought I had given mine such as constant cultivation, keeping the soil a dust mulch until September 1st and the planting of cow peas between the rows.

Yours,
W. A. COX, Nurseryman.

A "Safe" Crop

The Paper Shell Pecan Tree is of an enduring nature that can be handed down from father to son and yields a product for which there is an unlimited demand with no prospect of over production. It gives large returns from small investment and is a sought for production of large value in small bulk. At a hundred years of age it is a mere juvenile, while during that period it has marked the passing of three generations of men. There are 3,300 calories of fuel or food value in every pound of well developed paper shell pecan nuts; and it is the most important of any nut-bearing tree in the world.

Pineapple (Blight Proof) Pear Orchard in Bloom

PAPER SHELL PECANS

The Pecan is the South's most valuable tree. What the peach tree is to the commercial life of Georgia and California, what the apple tree is to the prosperity of the North and Northwest, the pecan tree is destined to be to the extreme Southern States.

It is the most remarkable of trees, ranges is the habitat of the hickory nut and scaly-bark. Age but serves to increase its vigor and add increasingly to the enormous profits it brings in to its owner.

The pecan is the general farm tree. Those planted with ordinary care, its life span can be measured in periods of a hundred years; and the older it grows the less care it requires. It is practically immune. When the pecan trees are once properly set, the farmer can continue to farm the land to corn and cotton against the time when his orchard will be worth \$1,000 per acre and become his fully paid-up insurance policy against old age. It can safely be said that for the man who lives on the land, no investment can compare in profits and safety of capital involved with that of pecan growing.

The grower of pecans does not as in the case of the vegetable grower, have to throw his whole year's labor in the gamble of reaching market ten days early. He does not, like the grower of fruit, deal in a perishable product, dependent for its value on cold storage facilities which he may not have and the lack of which forces him into the market regardless of price. The pecan grower has the world for his market; raises a crop so valuable in proportion to its weight that he is practically independent of the freight rate problem; and has the entire year to find the profitable market. It is the one single farm product over which the farmer himself has complete control and over which he can exercise independent action in choosing his time and place to market.

The past few years have brought people generally to the realization that the paper-shell pecan is the king of all nuts; and today over two-thirds of this country, the big paper-shell nuts are looked on as rare nuts—most suitable to send a friend as a mark of esteem and friendship. Dr. Kellogg of Battle Creek, whose products appear on all America's breakfast tables, says of the pecan:

"I regard the pecan as one of the very finest of nature's choice products. A pound of pecans contain more nourishment than any other known food. In the next century nuts will largely, if not entirely, take the place of meats on the bill of fare, and the pecan will assume its rightful place at the head of the list of nourishing and digestible foodstuffs."

While it is almost true that pecans grow "everywhere," yet it is a fact that the production of the finest nuts in size and flavor is confined to the sandy soils with clay or dense sand subsoils covering the range in the South of the Yellow Pine forest and the Cotton belt.

In this region the pecan reaches perfection. That there is something about this soil peculiarly favorable for the development of the pecan is demonstrated by the fact that seven out of ten of the most widely esteemed varieties of the paper-shell pecan originated on the Gulf Coast of Mississippi. In this immediate region of our nurseries are the old original trees and orchards from which such varieties as the Stuart, the Pabst, the Success, the Scalesy, the Russell and others have had their beginning. Horticulturists in this section have been studying the pecan for many years longer than growers in

other sections; and it can be said with pride that there is a greater and more intimate knowledge of the propagation and growth of the pecan tree on the Mississippi Coast than can be found in any other section. Trees grown in our nurseries are brought up under these most favorable conditions, and the public can rely with absolute confidence in the purity of strain and healthfulness of trees sent out.

We recommend the planting of nut orchards of the following varieties, which need no extended description: the Stuart, the Success, the Scalesy, the Pabst, and Vandeman.

Price List

Size	COX'S Early Bearing, Paper-Shell Pecan Trees			
	Each	Five	Ten	100
2 1/2 Feet	90	\$ 4.25	\$ 8.50	\$ 75.00
3-4 Feet	100	4.75	9.00	85.00
4-5 Feet	120	5.75	11.00	100.00
5-6 Feet	135	6.50	13.00	120.00

Large	250	12.00	22.50	200.00
Extra Large	350	17.00	30.00	275.00
Extra Special	400	19.00	35.00	325.00

PINEAPPLE PEARS. (BLIGHT PROOF)

Blight proof and to the growing of the Pineapple variety of pears in the South. In recent years, the introduction of the ornamental varieties has been made with success. Of this group, the Pineapple Pear has proved to be absolutely immune to blight and can be planted in any section formerly known as the blight area.

The Pineapple Pear is a very remarkable tree in the rapidity with which it comes into bearing and the size of the crops produced. The weight of fruit produced in this tree is almost unbelievable. A single tree during 1921 produced 57 bushels and in 1922, 65 bushels. Ready sale is being found at present at \$1.00 per bushel. There can be no doubt the pineapple pear will quickly become one of the most profitable of fruits and the many young orchards are now bringing to their owners a rich harvest.

The pear is unsurpassed for the making of preserves and jams. Its ripening period is so long that no trouble will be experienced in marketing.

We strongly recommend that every home-owner put in a few of these trees to supply his own table and the local markets; and the farmer who will set out a five or ten acre orchard will without question realize a very wonderful return on his investment.

PRICES OF TREES

Size	Each	Per 100
3 to 4 Feet	\$.60	\$ 60.00
4 to 5 Feet	.70	70.00
5 to 6 Feet	.85	85.00

days a year.

BLUEBERRIES (THE NEW FRUIT)

The Blueberry has recently come into notice. It has grown for many years in the forests of New Jersey and in North Florida, but until recently it has been grown only for home consumption by certain individuals, who happen to be acquainted with the trees. Now the trees are being propagated and the fruit is being handled commercially. It has proven that there is a ready market everywhere for the berries. Trees produce from 30 to 50 quarts per tree annually, from 7 to 12 years of age. The fruit retails at from 40 to 50 cents per quart in the open market. Trees come into bearing 2 years from planting and have never been known to have disease of any kind. They do not require spraying and are known to live 100 years. They ripen and are harvested during the months of June, July and August. Color of fruit is dark, bluish black, splendid texture. May be eaten with cream and sugar (as strawberries) or may be used for jams, jellies, pies, and in fact in so many ways until we would advise everyone to set trees of this splendid fruit.

Bulletin 974 of the U. S. Department of Agriculture, page 22, gives a record of a blueberry orchard. The trees were 7

years of age in 1919 and yielded 95.3 bushels per acre. Fruit sold for \$966 per acre, while in 1920 the same 500 trees produced 117.3 bushels per acre and the fruit sold for \$1277.

Same Bulletin, page 21, "Conclusion:" "The introduction of the blueberry into agriculture has a much more practical significance than the mere addition of one more agricultural industry to those already in existence. Blueberries thrive best on soils so acid as to be considered worthless for ordinary agricultural purposes. Blueberry cultivation therefore, not only promises to add to the general welfare through the utilization of land, almost valueless otherwise, but it offers a profitable industry to individual owners in certain districts in which general agricultural conditions are especially hard and it suggests the possibility of the further utilization of such lands, by means of other crops adapted to acid conditions."

Price of Guaranteed Unheaded Cluster Blueberry Trees.

F. O. B. Crestview, Florida.

Size	Per 10	Per 100	Per 1000
1-2 Inch Caliper	\$5.00	\$15.00	\$100.00
3-4 Inch Caliper	6.50	60.00	500.00
1-1/2 Inch Caliper	8.00	75.00	600.00

Cluster Blueberries Ready to Serve.

Think of "huckleberry" pies and then remember the Blueberry is the huckleberry's cousin with the seeds left out and the flavor developed by cultivation and the crossing of the best varieties.

Blueberry Trees thrive in ANY acid soil and bear during June, July and August, the second year after planting.
